4.9 Autumn Growth - Overall	23
4.10 Winter Growth - Overall	23
4.11 Spring Growth - Overall	24
4.12 Summer Growth - Overall	24

1.0 METHODOLOGY

1.1 Turfgrass Colour

Turfgrass colour was assessed on twelve occasions during the two year trial. Turfgrass colour is a visual assessment based on how dark green the varieties are. The scores range from 0 – being completely chlorotic to 9 – being extremely dark green.

1.2 Turfgrass Density

Turfgrass density was assessed on twelve occasions during the two year trial. Turfgrass density is a visual assessment based on the density of leaf material. The scores range from 0 – no coverage to 9 – very dense cover with no space between grass leaves.

1.3 Leaf Shredding

Leaf shredding was assessed on twelve occasions during the two year trial. Leaf shredding is a visual assessment of the amount of damage done to the tips of the leaves after mowing. Leaves that exhibit shredding have fine white strands protruding from the leaf tip. Leaf shredding has not been observed in any of the tall fescue varieties and therefore there is no table of results for tall fescue leaf shredding. The scores range from 0 – no shredding to 9 – extreme shredding.

1.4 Incidence of Disease

Disease only occurred during a one month period over autumn in the first year and was rated on a visual estimate of damage that had been caused to the surface. The disease pathogens present were *Curvularia* spp. and *Drechslera* spp. The scores range from 0 – no damage to 9 – complete loss of turf.

1.5 Seasonal Growth

Seasonal growth has been assessed on two occasions per season during the two year trial. The assessment is a visual estimate of the amount of vertical extension that has occurred since mowing was ceased. Assessments normally occurred two weeks after this time. The scores range from 0 – no growth to 9 – excessive growth.

2.0 RESULTS

2.1 Tables

The first two tables for each grass type and parameter represent the individual scores for each assessment date with the yearly average shown. The final table shows each year's average as well as the combined two year average and ranks each variety according to the two year average based on the LSD.

Varieties are significantly different from each other if the difference in value between two varieties is greater than the LSD figure. This is distinguished using an alphabetical listing where varieties with no common letter are significantly different to each other. Where there is a common letter the varieties are deemed to be not significantly different in their performance.

3.0 RESULTS – PERENNIAL RYEGRASS

Table 3.1: First year results for colour of perennial ryegrass varieties (0-9)

Variety	16/1/07	20/3/07	22/5/07	2/7/07	10/9/07	23/11/07	Average
