## Magenta Shores Golf & Country Club 2021

### Aim of PoaCure:

To convert green back from poa to original G2 Bent Grass. Poa was estimated to be as low as 20% but as high as 80% in some greens.

All greens received PoaCure using the 2L/ hectare rate and 4 applications. 3 greens received a higher rate of 4L per hectare as was deemed the poa in those greens was somewhat stronger and a higher rate was necessary rather than increase applications later on.

During the process the green surface remained playable and no complaints were received from the membership. There was constant communication with members on what was happening through newsletters and general communication. Full conversion was not expected until November 2021 in time for the summer.

The poa has all died and bent grass has been aggressively growing over the poa areas. This has been helped by cultural practices to manage bent grass as well as a nutrition program to increase nitrogen slightly throughout the process. Some seeding is taking place 45 days after the last application to increase bent grass population in larger areas as well as some plugging. All this is part of the process and was expected due to high poa population.

### Conclusion:

Some poa has re-emerged after 12 months as expected coming from such a high % however most greens starting from 80% poa are now less than 15% and will be cleaned up in 2022

### Application method:

Water volume per hectare 640L/Ha

Nozzle types Grey Air induction 50cm spacing

Water in amount after application 6mm

### Applications 2L/ha

1st application -7th June

2nd application -5th July

3rd application -2nd August

4th application -30th August

We would like to thank the superintendent for using PoaCure and the General Manager (Rob) who have supported the use through James Newell.

*"The ability to use a product like PoaCure gave us the confidence to transform our Poa/Bent putting surface to pure Bent grass surfaces. I knew it was going to make a difference, but it exceeded my expectation, it visually highlighted the contours in our greens, and agronomically it has helped to a great extent with our goal being more environmentally and financially sustainable."*

James Newell

# PUTTER

10<sup>th</sup> June 2022

365 days after initial treatment the putter has some poa regenerating as expected due to such high poa amount 1 year ago (>80%). However the reduction has been nothing short of amazing with less than 15% poa present now. Taking out this poa will be very simple with the standard PoaCure program.

10<sup>th</sup> June 2022

This was one of the highest population of poa greens on the course. Some poa remains however the conversion has been amazing as seen. The green plays better and more consistent.

10<sup>th</sup> June 2022

The poa i this green was not as much as other greens and the poa was eradict rather than dinner plate size which allowed the super to utilise the 4L/ha rate.

However a high poa % was still present.The higher rate was used for a quicker transition to full bent grass. This green will not need to be treated in 2022.
